CSS STYLINGS

My primary contribution to this project was the front-end development of the web application. The focus of my work were the visual presentation and user interface styling of multiple components of the web application. This entails the creation and application of a consistent palette theme and the layout of page components across the following pages of the final application:

1. `Quiz.js`: Created the initial CSS styling.
2. `QuizReview.js`, `QuizHistory.js`: Created and ensure that CSS styling are consistent with the rest of the web application.
3. `Home.js`: Created and maintain the landing page of the web application.

MAJOR TECHNICAL CHALLENGE AND RESOLUTION

One technical problem was to find an implementation of the CSS styling such that each page of the web application can display their contents without visual defects. The issue was that HTML definitions of a page are wrapped by `main.main-content` with `max-width` set to `800px`, leading to pages unable to fully contain their layouts. This was fixed by changing to `max-width:100%` and adding `width:fit-content`.

Another challenge encountered during development was the integration of the Home page into the existing application routing structure. Since the application was originally designed to use the authentication page as its entry point, introducing a new landing page required a restructuring of the route configuration in `App.js` to ensure that users were directed appropriately based on their authentication state.

Additionally, the app originally did not correctly account for smaller screens with its layout design with many components having fixed minimum sizes that cause overflow. This was fixed by making changes to `App.css` styling and minor changes to pages with unique layouts (`Quiz.js` and `Admin.js`).

GIT COMMIT HISTORY ANALYSIS

Commit Hash	Explanation
d41ed07	Initial contribution to the project. Add basic styling for user-facing pages of the app and implementation of a link to review page immediately after completion.
f85d707	Adjust CSS styling of the quiz review and history pages to better match the application's quiz page layout.
6de1c17	Implementation of <code>Home.js</code> , including underlining logics, page layout, and connecting the page to the rest of the app.
acf36ec	Minor changes to <code>Home.js</code> to better fit group's design decision and assignment specifications.
6a45b54	Changes to CSS stylings in <code>App.css</code> and <code>Admin.js</code> to better handle smaller screen sizes.

REFLECTION ON DESIGN DECISION RELATED TO GROUP'S VARIATION

For the front-end portion of the group variation, an additional page was added to the web application so as to view the answer chosen for a quiz attempt. This page is also linked in the quiz page after submitting an attempt.

In this review page, for each question, we displayed both the chosen answer and the correct answer, followed by a result sentence to indicate if the two answers matched. Due to its text-based layout, I chose to high this result with different colors for correct and incorrect answers to allow the users a quicker identifications of questions that they've gotten wrong.

Overall, my decisions over the variation were made with the goal of improving readability of the app as a whole.
